

Money Flow Operations

Every dollar's path through Puddl3 – from an employer's bank account to a worker's wallet, and from withheld taxes to the IRS – traced end to end.

Solid arrows are money moving. The clock-out event is where each payment splits in two — net pay continues down to the worker, withheld tax branches into the trust pool. The teal paths are where Puddl3's own revenue accumulates; the amber path is the single highest-priority open legal question in the whole model.

— money movement - - - revenue roll-up - - - flagged legal risk

- 01

Employer funds

Bank/debit pull converts 100% to USDC immediately — the whole deposit becomes the yield-bearing Payroll Wallet, not just the eventual net-pay portion.
- 02

Wallet sits, earns yield

Undisbursed USDC generates yield continuously. Puddl3 takes a flat cut; the rest returns to the employer — marketed as a benefit, not just a cost offset.
- 03

Clock-out splits the wallet

Up to 2×/day, each independently final. Net pay and withheld tax leave the wallet as two flows that never recombine.
- 04

Net pay → worker, in seconds

Stellar settlement lands USDC in the worker's wallet almost instantly — the core product moment.
- 05

Withheld tax → trust pool

Stays as USDC, still earning yield, until shortly before the statutory deposit date. Whether this yield is even permissible is the top open legal question.
- 06

Remittance

Converted back to USD and remitted to the IRS/state by the embedded payroll partner, acting as Reporting Agent.
- 07

Worker spends or cashes out

Card spend, free standard ACH, or an instant 2–3% fee withdrawal — the fee and interchange both roll up into Puddl3's revenue.
